

Spotify Clone Project Review

Spotify Clone Project Review

Project Overview:

- React + Vite + Tailwind CSS
- React Router DOM for navigation
- Context API for global player state
- Static assets for songs, images, and icons

What Works Well:

- Home page displays albums and songs
- Album navigation uses React Router
- Player controls play/pause, next, previous
- Seek bar updates during audio playback
- Responsive sidebar with mobile overlay

Issues Found:

1. Album ID parsing in Display.jsx uses `location.pathname.slice(-1)` and breaks for multi-digit IDs.
2. DisplayAlbum.jsx shows all songs, not album-specific songs.
3. Invalid route IDs can crash the album page.
4. Shuffle/loop/volume icons are UI-only with no functionality.
5. Audio duration may show 00:00 until playback loads.
6. Navbar history buttons can misbehave without browser history.

Interview Talking Points:

- Built a Spotify-inspired music player clone with React, Vite, and Tailwind.
- Used Context API to manage audio playback state and refs to control HTML audio.
- Implemented routing for home and album pages.
- Faced synchronization challenges between audio element state and React rendering.
- Planned improvements: album-specific tracks, shuffle/loop, backend/API, improved data model.

Next Improvements:

- Fix album route parsing with `useParams`.

- Add album-specific song lists and route validation.
- Implement shuffle, loop, and volume controls.
- Add loadedmetadata event for audio duration display.
- Improve accessibility and alt text.
